The relationship between maxillary growth and the environment of the maxillary suture has not been completely understood. The purpose of this study was to analyze the relationship between the environment of the maxillary suture and the function of the maxilla. Sixty patients with a mean age of 11.6 +/- 1.57 years were analyzed. The environment of the transverse maxillary suture was evaluated by light microscopy and histologic examination and was classified into suture closure, open suture, and dehiscence type. The patients were divided into two groups according to sagittal growth of the maxillary suture. The age of the patients in group I (closed suture) was 10.1 +/- 1.07 years and in group II (open suture) was 11.5 79a2804d6b
