The mobile advantage of the X-T1 is the electronic viewfinder and tilt/swivel monitor. The lack of a touchscreen interface obscures the benefit. At least with the X-T1, you can control the camera from a computer with the supplied remote. This makes sharing with others easier. This reduces the need for video conference which is only available on a desktop or laptop. The Fujifilm X-T1 has a unique feature in the form of the X-Trans sensor. This has allowed Fujifilm to give the X-E1 the same AF ability that the X-T1 offers. This is partly because the base model is cheaper. Fujifilm has also been able to make the X-E1 perform better than the X-Trans in some ways. However, it is still limited to one maximum ISO of 12800. It can be expected that with newer firmware, that number will go up as well. Apple's Lightroom app for Mac is getting a small update today that adds support for the newest iPhones, improves the processing of images, and a ton of other useful improvements. The update mostly focuses around the sharing functionality of the app and allows users to do more with image adjustments and editing by using the iPhone's cameras. Among the changes headlining the update, the Lightroom app on iPhone update added support for the iPhone XS, XS Max, XR, and XS, updated the corresponding libraries to reflect the new models' respective changes, changes like new image and video stabilization options, and new filters and effects, and improved processing for other collections and libraries. While it was a relatively minor update, it's important to note that it comes mere months removed from Apple's App Store update, and people are still discovering new features throughout the app. Especially since this is an app that runs on millions of devices, it may take some time for us to see all of the new additions.

After we are done naming our image, we will click and drag the image into the canvas to create our image. For this tutorial, we will be creating a full background, so we will drag the image to the canvas and we will be given the option to drag the edges of the image. We will chose to resize the image. After resizing the image, we will click anywhere in the canvas to create another image. You can create as many images as you want from the same image by using this process. We will drag the image into the canvas, and begin to create our own light version of the image. For this tutorial, we will be changing the colors to blues and ambers. Now that we have our first image in the background, we can begin to outline our image. In this tutorial I will be outlining a simple pattern of a dot. Click the art board and begin to draw out my photo with a black pen, or a soft pencil. We will be outlining my photo near the corners and black art board background with a black ink. Once you are done outlining your pattern, break it up with any polygonals that you would like. If you would like to outline your pattern with a stylus pen or pencil, the tip usually has to be removed from the pen and you would use the eraser. The idea of running software as complex as Photoshop directly in the browser would have been hard to imagine just a few years ago. However, by using various new web technologies, Adobe has now brought a public beta of Photoshop to the web. By using the web, you can get all the advantages of Photoshop and more, without all the "crap" that comes along with the application. Adobe has managed to make Photoshop a web application, so you can do anything on your computer without leaving the comfort of your home. However, it is still recommended that you dual boot the operating system. e3d0a04c9c

In Photoshop CC 2017, the powerful new GPU-based rendering technology lets you make real-time, lightning-fast high-dynamic-range (HDR) adjustments. Photoshop CC 2018 now takes advantage of the exact same system inside, giving you powerful new means of creating and working with incredibly high-dynamic-range images. When we first proposed this new technology, we assumed that the next wave of GPU hardware would be pretty much green fields—that is, new GPUs would be coming out with the sky open above the chip makers, and none of them would have broader compatibility than the existing NVRAM-based approach. So we looked beyond this, and decided to look into the future, and develop our own “cloud effect” technology to adapt to the next wave of GPU architecture. And that future is with us today. Today, we’re moving from the traditional NVRAM-based, opaque-objects-based OpenGL API approach, to a fully-opaque-objects-based, completely GPU-driven OpenGL API, called the MTL (Metal-Technologies-Library). Our new graphics engine is built directly onto the GPU hardware, and we’re taking advantage of all the processing power in the GPU to enable faster performance. We’re also taking advantage of the very broad compatibility of the Metal API to realize the full potential of modern GPU hardware. Our new technology can also be used as a rendering backend to the popular GPU-accelerated editor, Adobe XD. This new technology is what enables Photoshop CC 2018 to make real-time global image-reflighting on the GPU.
